

1 Feature Prioritization & Trade-offs

Objective

Prioritize next-sprint features that improve customer retention, increase order conversion, reduce checkout friction, and deliver high business impact within manageable engineering effort.

Frameworks Used

RICE — Quantifiable prioritization MoSCoW — Sprint commitment & stakeholder alignment

Feature Evaluation (RICE)

Feature	Reach	Impact	Effort	Confidence	RICE Score
Push Notifications	High	High	Medium	High	Very High ✓
Apple Pay Integration	High	High	Med-High	High	High ✓
Favourite Items	Medium	Medium	Low	High	Medium
Live Chat Support	Medium	High	High	Medium	Medium

Sprint Selection — Top 2 Priorities

#	Feature	Business Value	User Value	Why Now
1	Push Notifications for Delivery Updates	↑ Trust · ↓ Support tickets · ↑ Retention	Real-time order visibility	Moderate effort; fast rollout
2	Apple Pay Integration	↓ Checkout friction · ↑ Mobile conversion	Faster, secure checkout	Competitive parity

Deferred: Favourite Items → Limited Availability phase after validating ordering behavior. Live Chat → Later cycle (requires vendor eval, SLA definition, support staffing).

Release Strategy: EA → LA → GA

Phase	Audience	Goal	Key Metrics
Early Access (EA)	Internal employees, beta & power users	Validate stability & usability	Notification open rate · Apple Pay success rate · CSAT · Crash rate
Limited Avail. (LA)	10–20% regional rollout	Validate scalability & conversion lift	Checkout conversion · Repeat order rate · Support ticket volume
General Avail. (GA)	All users	Full-scale rollout with dashboards	Tableau · Pendo · Jira · Jellyfish dashboards

Stakeholder Communication

Communication anchored on customer impact data, RICE scoring visibility, engineering feasibility, and sprint capacity. Key stakeholders: Engineering, Design, Customer Support, Marketing, Operations, and Leadership. Style: transparent trade-off discussions with outcome-based prioritization and shared success metrics — eliminating opinion-driven prioritization.

2 JIRA User Story — Spend Rate & Runway

Epic: Financial Insights Dashboard

As a Business customer

I want to	View my average spend rate and monthly gross spend trends
So that	I can monitor spending behaviour and make informed financial decisions

Functional Requirements

Dashboard Widget • 3-month average gross spend • Total gross spend for last month • % increase/decrease vs prior period • Visual trend graph Graph • Monthly spend bars • Target spend rate line • Hover tooltip: amount · month · variance	Acceptance Criteria • Data loads within SLA response time • Graph updates dynamically on date range change • Responsive on tablet & mobile • Currency formatting supported • Accessibility compliant (WCAG) Tooltip Content • Spend rate definition • Monthly comparison logic
---	--

3 Analytical Thinking & Troubleshooting

Scenario: 30% drop in signup conversion after a release. Here's my structured diagnostic approach:

Step 1 — Validate the Problem	Confirm the drop is real and not a data pipeline anomaly. Identify which platform is affected: iOS, Android, or Web.
Step 2 — Funnel Analysis (Pendo)	Track form abandonment, error occurrence rate, API failures, and time-on-field across the signup funnel.
Step 3 — Engineering Collaboration	Reproduce the issue, review recent deployments, analyse backend logs, and validate frontend/backend validation behaviour.
Step 4 — Root Cause Hypotheses	Aggressive validation rules · Generic error messaging · API timeouts · OTP or email verification failures.
Fix & Rollout	Deploy fix to internal users first (EA), monitor signup completion rate, error frequency, and time-to-complete. GA only after conversion recovery validated with no crash increase.

4 Client-side vs Server-side Tracking

	Client-side Tracking	Server-side Tracking
Pros	Faster implementation Rich UI interaction data Real-time event visibility	Highly reliable Better data consistency Secure & scalable
Cons	Ad blockers reduce coverage Event loss risk Less reliable	Higher engineering effort Slower implementation
Best for	UX analytics · Clickstream behaviour	Payments · Orders · Revenue events Critical conversions

Recommendation: Hybrid Model — Client-side for UX analytics and clickstream behaviour; Server-side for payments, orders, and critical revenue events. This is the most scalable and trustworthy analytics architecture for enterprise-grade products.

Customer-first Prioritization	Data-driven Decisions	Engineering Collaboration	EA → LA → GA Rollout Strategy	Clear Metrics & Governance
